Description

Welcome to the first of three documentary episodes from Aqua Nor 2025. Aqua NOR Digital 2025 | Ep. 01 – “Feeding the World” | Part 1/4 Subtitle: Introduction Description: In Part 1 of 4, we kick off the series: Host Arne Hjeltne opens the episode A grand opening with His Majesty The Crown Prince of Norway Highlights from the Aqua NOR conference An in-depth interview with Sergio Nates from WWF Produced by Liwlig

Video Transcript (grouped by 1.5 minute intervals)

[00:00 - 00:00]

Heat up here. Heat. Heat. Heat. Heat. Welcome to Aquanur 2025. Everyone is here. fish farmers, suppliers, politicians, scientists, and we are

[01:30 - 03:00]

ready to dive into how to produce enough food for the world without harming marine ecosystems or contributing to biodiversity loss and still keeping economic sustainability. In other words, how are we going to feed the world? Before we dive into this, let's go to the grand opening with his majesty, the crown prince of Norway. Please welcome up on stage his royal highness, Crown Prince Hok of Norway. >> We hereby declare Aquanur 2025 officially open. Hello. Oh my god.

[03:00 - 04:30]

All the 200. What a fantastic royal opening of Akwan 2025. And this is what you can look forward to seeing in this first episode, Feeding the World. Each year, Akenor kicks off with the Akenor Conference where politicians, scientists, and industry leaders set the agenda for the debates. And of course, we were there. All the companies and all the speakers on stage demonstrated that they are boldly investing and developing in new solutions that are very much needed for the industry to move towards a more sustainable and more productive industry. >> Well, it's not like you can separate all the ocean industries. We all have to

[04:30 - 06:00]

work together to utilize the technology and the resources that we have to use the ocean in a better way. When we have a a global population growth up to 2050 where we are approximately expecting 9.5 billion people, if we still are going to eat the same amount of fish, we must increase the production by 30 40 million metric tons. That's a big challenge, but it's also a big opportunity. >> Seaweed can be the solution, can be one of the solutions. It can be a very relevant food for populations that are undernourished because seaweeds are rich in minerals. >> And now with the subse production, it changes everything. It changes everything for Norway. It changes everything for for different countries. But the subsea and the more exposed farming is coming and it's really big. >> If you look into the sea, it's several thousand of different species that we can grow. And also this uh copper pod that we have produced in seaweed. We are only producing one copper pod today. But there is also several thousand species that we can produce. >> A lot of people don't know how advanced the aquaculture industry is. It's not old men in knitted sweaters throwing out feed into some kind of pan. There are so many small, medium, and large companies serving the aquaculture industry with so many different technologies. It is a technological advanced industry. Norway is the salmon capital of the world. So,

[06:00 - 07:30]

there's no better place for me to come and and find new and exciting technologies that I think I could showcase really well to my online audience. >> We also need to look into how the we treat the fish, how we feed it. If you have uh the correct nutritional profile on your feed, you can also make it stronger to withstand the sea life. So I think marine ingredients there is really a a key factor. >> The main cause of mortality is infections and diseases. So obviously they need to have good control of detecting diseases and of course also handling them. >> The biggest potential in farming is the people. Everyone in the company needs to have that ownership to results and that understanding of the biology and of course the impact they make on of the environment. >> I think to wake up every day and think how can I today contribute to produce a little bit more food little bit more sustainable in a little bit better way and then over time you will create a difference. I think sometimes it's it's a matter of finding that entrepreneur who wants to take the first step you know and once that entrepreneur takes the first step then people would follow you know like they say in the movie build it they will come seratis we have seen of course here at Aquanu lots of the modern initiatives lots of new technology uh many investors There's uh there it's an it's an industry that's quite techsavvy. But where do you see the

[07:30 - 09:00]

largest potential for aquaculture in the world in terms of of developing more food from the ocean? >> Well, I always point out that three4s of this planet is water and so it's going to come from offshore agriculture. I think so. I think there's going to be some inland aquaculture and there's certainly some inland aquaculture

but I think there's going to be some development big developments on the offshore aquaculture you know and when it comes out to technologies uh I think that we all know and I'm going to be preach here AI is going to play a big role of you know how agriculture develops but this can can this also be an important source of creating jobs in in some developing countries can this mean something to the societies in the future. >> It does and I and I and I think I I pointed out this morning, you know, the two perfect example of that are Norway and Ecuador. >> Yeah. >> You know, which are, you know, on one side the largest salmon producer in the world and also the large shrimp producer in the world. >> So the amount of jobs that are being generated in in Norway and the amount of jobs that are generated in in Ecuador from the aquaculture industry are, you know, large. So yes, I think that other countries as agriculture develops, you know, there'll be more jobs available for for people, you know, to come and work in this industry. >> Yeah. Because it's not just food. Somebody has to produce it and it's >> somebody has to produce it. Correct. And

[09:00 - 10:30]

you were talking also um to a lot of investors here and you were talking about how important the investment opportunities are in in this industry that there there is a need of of capital and I I sort of conveyed you as relatively optimistic for investing in aquaculture. I have because like I said I have been in this industry for a long time and and there's always risk and there's always risk when you play with you know with with something that has biological properties like fish or shrimp you know it's not different from chickens or swine but we have seen the consolidation on the shrimp on the on the swine industry and the poultry industry and I don't see how the seafood industry or the aquaculture industry cannot be the same. I I think sometimes it's it's a matter of finding that entrepreneur who wants to take the first step you know and once that entrepreneur takes the first step then people would follow you know like they say in the movie build it they will come. >> Yeah. So you you you you still think it's a a young business. >> Yes it is. It is. I I I think we still have a lot to learn. You can count your chickens. You know, the fact that aquaculture is a three-dimension system makes a little bit more is more difficult. So, in the salmon industry, it's easy to use cameras and and you see your animals and you can count them. You know, the other industries, the other aspects of aquaculture, like in the shroom industry, it's not as easy to

[10:30 - 12:00]

count the animals, uh, etc., etc. That's a little bit more complicated, but we will get there. I'm pretty sure that we we're going to get there. And finally, where do you see the biggest challenges are from um taking care of the ocean uh and still being able to feed the world uh in a sustainable way. We don't have unlimited resources on this planet. So, we're going to have to figure out, you know, agriculture is going to have a demand to now we know that we require some somewhere between 55 to 60 million metric tons of feed. those ingredients to make that feed has to come from somewhere. Uh I think that feed might become one of the bottlenecks. Uh and the sourcing of sustainable ingredients without affecting the the the environments. I think that that might be the major challenge. We will always have challenges, disease challenge, sea lice in the case of salmon is a good example. Some of the shrimp diseases in Asia etc etc. But I think how we're going to feed the animals uh might be the biggest challenge. >> And yourself uh coming here to Trondheim for Aquanor, what are your uh expectations for your stay here? >> It's always very nice to come to Norway because you guys always one step ahead, you know, you're always one step in the curve and and uh if I always say that if you want to be good in something, you do

[12:00 - 13:30]

as the people that do good in something. So you just copy them. So if this is the agricultural industry in the world wants to um be as Norway, come to see Norway, you know, somebody wants to grow shrimp, go to Ecuador. You want to grow salmon, come to Norway, you know, and you find out that, you know, learn from the best. >> That's a good advice. I wish you a successful day, Saint. >> Thank you. >> Nice meeting you. >> Thank you very much. Nice to meet you. >> Thank you. In the next part, we'll dive deeper into the challenges regarding feeding the world. And as we all know, with challenges comes solutions.
