Description

This is part three of four, in the first documentary episode shot at Aqua Nor 2025. Aqua NOR Digital 2025 | Ep. 01 – “Feeding the World” | Part 3/4 Subtitle: Aquaculture in a Global Perspective
Description: In Part 3 of 4, we dive into some of the big questions: Meet this episode’s Next Generation A conversation with Minister of Fisheries, Marianne Sivertsen Næss Explore the untapped potential of krill Visit one of this year’s largest stands Produced by Liwlig

Video Transcript (grouped by 1.5 minute intervals)

[00:00 - 00:00]

Welcome back to program one part three. Shortly we'll hear from our Minister of Fisheries, Mariana Catson Nes. But first let's check in with the next generation. foreign. Super. High five. 400. Wow.

[01:30 - 03:00]

for controll. Forecraft forch. for

[03:00 - 04:30]

protection. We said also the for

[04:30 - 06:00]

Foreheads and more system. And also something >> I have a new guest. It's uh Kieran K R&D director at AQC. We are going to talk about Krill because you are presenting Krill here at Aquanur 2020. And what is your message to the conference this year? In my presentation, I will be presenting for the first time the published field report uh where the krill meal is included in the Atlantic salmon small feeds after their seawater transfer and how a krill can help in improving the growth and survival of those fish after their seawater transfer

[06:00 - 07:30]

>> because it's extremely nutritious. >> Yes, it's full of nutrients. It's sustainable. So yes and those nutrients can help the fish to cope better the stress they face after they are transferred to the seawater because it's really a challenging and uh critical phase. So then adding like uh good nutritious ingredients such as krill meal can help the fish to cope better during that critical and challenging phase. So that's like kind of the main take-home message and why it is important because uh we do a lot of things in the lab where the conditions are controlled but then doing something in the real life scenario for example this field trial that I'm presenting so kil works as good as in the lab where the conditions are controlled but at the same time we see the same effects in the real life scenario so that is kind of the USP of this study I would say >> the hypothesis is has proven right >> in the real life And as you know there is a lot of talk and a hunt for more marine ingredients >> in the in the feed. >> There are so many initiatives on on creating protein from everything from seaweed to off gases and microalgae and how important do you think krill will be in in the next generation of salmon feed? >> We should not forget the basic nature of salmon that it's a carnivorous fish. It needs some marine ingredients because certain micronutrients the fish can get

[07:30 - 09:00]

only from marine ingredients. >> Yeah. >> And that's why but we should not overexploit the marine ingredients. They should be used cleverly and as a functional ingredient especially during the critical phases when the fish really needs it. For example during the seawater transfer >> and and will krill be a substantial part do you think of the feed? Yes, because of the volumes and then because of the stable volumes that are available and the nutritional nutritional value that krill has and then on top of that it has high palatability. >> It's like a small shrimp. >> It's a crustation. Yes. So, uh salmon loves it because in the wild as well they love to eat it and not only because of the taste because of the nutritional value as well. uh especially during the critical phases when they move to the seawater it's the osmo osmotic stress that they face and they really need the nutrients from these frustrations during that phase. So yes it could be a nice enabler to enhance the palatability and then to complement some of the things that are missing in the novel ingredients. >> Yeah in the total diet. >> Yes. >> And it could maybe be good for you and me to have some krill too. >> Yes. The krill oil. Yes. Totally. because omega-3s and other nutrients for example coline esters and very popular is really really important. >> So keep an eye out for krill it's coming more and more and thank you so much Karen. >> Thank you for having me.

[09:00 - 10:30]

>> I'm at the stand of Aqua Group one of the really big stands at Aquan Kut. You have been in this industry for a very long time. >> Yes. Yes. Uh do you still remember your first time at a node? >> Yeah, that must be 25 years ago or something. I'm I'm uh I've been tourious in industry. So you wonder whether you are part of the solution or part of the problem, but I enjoy it myself. I think it's really fun to be part of this industry. >> This theme in this episode is feeding the world. >> The world needs more food and and

what is Aqua Group's role in in this really big challenge? If you go 30 years back farming fish and producing fish protein by the fish farmers that was a very small industry and today it's as we know bigger than the fisheries and what you need to drive the blue revolution is also technology and solutions and aqua group is providing technology and solutions. This company started really in the agriculture business and you're you went into aquaculture. How did that happen? It was back in the 1980. It was a very smart inventor. His name was Ulam. He he was inventing the uh robotics for for the car industry to do the automation of the painting of the cars and he was traveling around seeing that the fish farmers they were hand feeding the fish and he thought I can

[10:30 - 12:00]

automate the feeding because you cannot do hand feeding. So, so that was the very first innovation. So that was the start of Aqua Group. >> You're part of this bigger purpose. >> Yes. >> Is that something that people sort of have in their mind every day when they're thinking of new solutions? >> I think so. The the vision of the company is pioneering a better future. So we have been pioneers actually all history go all the way back to 74 when we invented the very first plastic cage. And note this one what you see here is bringing fish stone in the deep. >> This is like submerged. >> This is submerged. So we call it deep farming and it's about bringing the fish below the sea lice belt. >> Yeah. >> And also we see other purposes than just the sea lice belt. For instance in Turkey they found throat in the Black Sea. >> Yeah. >> And we can be below the hot water uh in the surface there are down here >> 26° in the summer. That's too hot for throat in the Black Sea. Now we bring the fish stone and it's 15 Celsius 30 m stone. perfect for farming >> and and where do you see we have the biggest challenges in in actually feeding the world I mean the fundamental issue is the same area it's about uh fish health fish welfare bringing down mortality and having as uh optimized uh feed conversion rate as possible those are the same fundamentals uh across the species so so in that sense there are

[12:00 - 13:30]

generic challenges >> and aqua group is uh going to be in on all the different challenges we meet. >> We we cannot do it all, but we want to grow. That's for sure. >> Good luck. Thank you. Thank you. >> Stay tuned for the fourth part of this episode where we will talk to an expert regarding the potential for tunicates before we reveal the catch of the day.
