Description

The fourth and final part of the first documentary episode, shot during Aqua Nor 2025. Aqua NOR Digital 2025 | Ep. 01 – “Feeding the World” | Part 4/4 Subtitle: Catch of the Day Description: In the final part of Episode 1, we wrap up with some highlights: Discover tunicates and mussels Reveal the Catch of the Day Summarize the key moments from this episode Get a sneak peek of the next episode Next up: Episode 2 – “The Next Big Thing” Produced by Liwlig

Video Transcript (grouped by 1.5 minute intervals)

[00:00 - 00:00]

Welcome back to our program feeding the world part four. We have looked at challenges and solutions to the topic of feeding the world. But next we are going to examine other creatures from the ocean for feed and for food. Question remains is it tasty? Eric Yan Lock, research director at Noima. There is more to the ocean than just fish. >> That's right. >> And you have been looking into other resources both for feeding more fish in aquaculture, but also for us humans. What kind of projects have you been working on? >> Well, my focus or my group's focus is mainly on on feed, but in the end, feed also becomes food. But we see a lot of synergies between uh low tropic so organisms other than fish from the ocean. >> The interest in that from both the food and the feed perspective and I don't think one has to exclude the other. If you are producing something you can produce for both markets. >> You have been looking at muscles as a feed for aquaculture. >> Yes. The reason for that is uh the industry is looking for good quality protein and good quality lipids. And now there's a big incentive to look at what

[01:30 - 03:00]

can we produce in Norway that creates new companies that can go into feed and food. And then these low trophic organisms from the sea that do not require feed that do not require fertilizer that do not require fresh water even how can we use them? >> Yeah. And I have been particularly interested in tunicquets. So what's the story with tunicquets? >> So so the interesting thing with tunicquets is it's it's the most primitive animal there is on the planet. >> It's an animal. >> It's an animal but it's the only animal that makes cellulose. >> Yeah. So the outside of the of the animal is cellulose and the inside is animal protein and uh also omega-3 fatty acids. So it is the inside mainly that we going to use and it tastes like meat. >> It's amazing. >> Yes. And another good thing and that's maybe also why there's such a large interest for that because we know the situation in for example Oslo Fj. >> Yeah. >> Where there's too much nutrition coming into the fjords. Now animals like tuna or blue muscle are filter feeders and they take those nutrients out of the water. So they can serve as a cleaning of the fj for nutrients in a good way because we you can use them later to feed ourselves again. >> Yeah. So the tunic actually drive on uh too much waste into the fjords. >> Yes. >> Oh that so there's a double purpose.

[03:00 - 04:30]

>> That's a double purpose. But >> that's very interesting. Thank you. Thank you very much. There are so many interesting things that are unexplored and some that we are starting to explore. Next here in our program is the award young fisher. >> It is a pleasure to present this year's Young Fisher award. >> Congratulations. >> I'm just really proud and thankful to be working in the agriculture industry. It's a great place to be for young people. >> You were awarded the Young Fisher at the grand opening ceremony. >> Yeah. >> From the organization uh Young Fish, which is an organization for young people in this industry, isn't it? >> Yeah, it is. So, it was really uh great to be honored to get that prize. I didn't expect it at all. uh but really fun and I'm so thankful for for getting this opportunity. Yeah. >> Yeah. It is quite an honor because it goes to someone who has been influencing the reputation of this industry. >> Yeah. >> And uh you are working with with salmon and how did you end up in the aquaculture industry? Well, I'm I'm I have to say I'm kind of born into it because uh we are having a family business that my grandfather was established back in uh 1973.

[04:30 - 06:00]

So, we've been doing the salmon business in uh over 50 years. So, uh I from I was a little girl I've been with my parents to work and uh learned about the salmon industry. >> You have to tell us where are you located? >> So, we are located in south of Trams. So uh we over the Arctic Circle. Yeah. >> And that's why the name of your salmon is the northern light uh salmon. What kind of advantages do you think you have in this beautiful area in the south of Trams? >> Oh, I think we have advantage because we have the great cold sea. We use new technology and take care of the the salmon as best as we can. And how do you see the development of your family company? What what's the future going to be? >> I'm really hoping our business is is uh is big in the future as well and that we are still familyowned and local uh and uh uh contri contributing to the societies uh in the north of Norway as well. It's really important. >> And where do you export it to? >> Uh all over the world. Uh actually uh a lot goes to to Europe but also Asia. Uh big markets there growing. So no we we sell our salmon all over the place >> and and as you know Asians >> love the Northern Lights.

[06:00 - 07:30]

>> Yeah. >> I think that's a great great idea. So congratulations so much for the price. >> Yeah. Thank you >> and good luck with the Northern Lights salmon. >> Thank you so much. Can we feed the world with aquaculture? What have we learned? We know that we will need new technology. And in our next episode, we are looking at exactly that, the next big thing. In this program, we've heard from scientists, producers, industry leaders, and next generation innovators. The message is clear. With big challenges comes big opportunities. Today, only a small portion of our protein comes from the sea. Even though the ocean covers more than 70% of our planet, can we increase this and do it sustainably? Maybe the future of feeding the world is swimming in the sea. The work has already begun. In our next episode, the next big thing we are going to look at what holds in the future of new innovative solutions for the aquaculture

[07:30 - 09:00]

industry. Stay tuned. Heat. Heat. Heat up here. Heat.
